

What is PrintSpots™ Corporate?

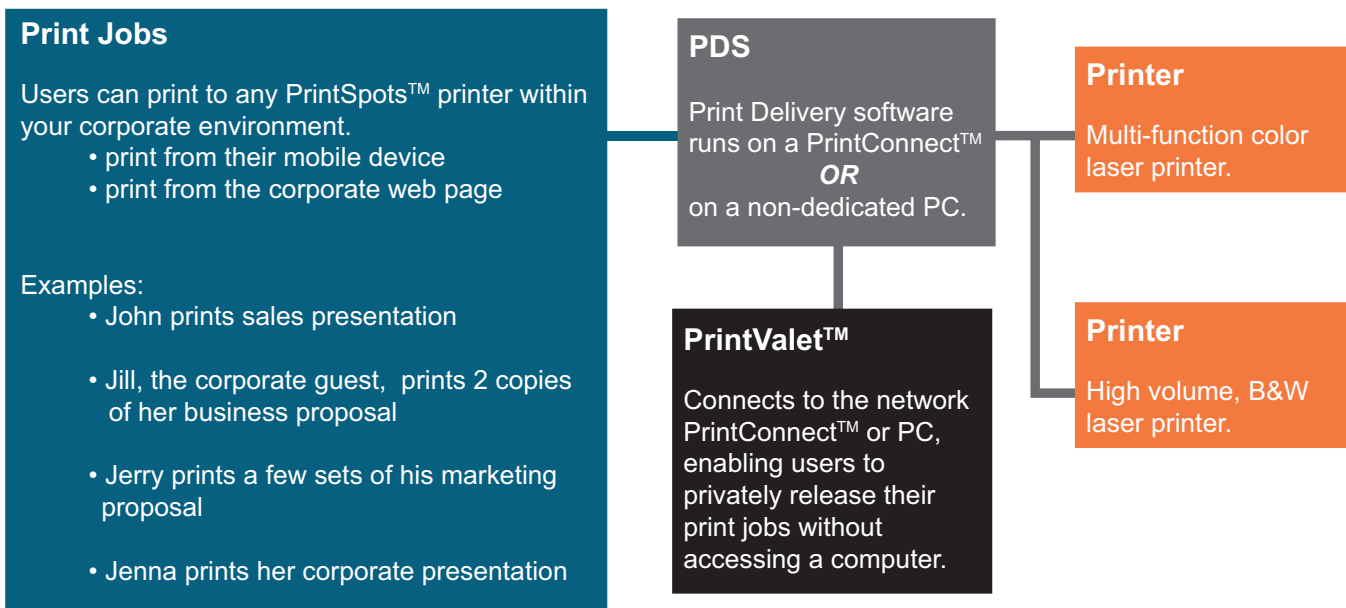

PrinterOn® easily enables mobile printing within your corporate environment. Simply put, any number of users can print from their mobile device or Internet-enabled laptop to a specific PrinterOn-enabled printer at your location and privately release the print job on the PrintValet™ keypad. You may extend the benefits of this service by offering several printers with different functionalities.

How does it work?

Mobile Printing - Users simply <forward> any email message and attachments to the email address of the PrintSpots™ printer at your location. A reply email will be sent from PrinterOn with a private release code to use at the printer to release their print job.

Web-Based Printing - PrintSpots Corporate provides a branded web page that is easily accessed with any web browser. Users surf to your PrintSpots web page to submit their documents for printing. The specific printer is chosen and the user clicks the <print> button to submit the print job.

Secure Webpage Printing - By installing our universal print driver PrintWhere®, all desktop and laptop computers automatically find the PrintSpots printer at your location. Users are able to print information from secure web pages such as boarding passes, travel plans, statements, rental agreements, etc.

How is it set up?

- 1 The PrintSpots mobile printing software is installed on the PrintConnect™ OR any non-dedicated, networked PC near the networked PrintSpots printer.
- 2 Connect the networked printers of any make or model to the PrintConnect OR PC.
- 3 Plug in the PrintValet keypad into the PrintConnect OR PC.

Mobile Printing Specifications

PrinterOn® hosts the server for PrintSpots™ Corporate. This secure server performs the document conversion and intelligent, secure delivery to the target printers at each printer location. The PrintSpots mobile printing software operates as a background task for commonly needed print queue and delivery functions.

The mobile printing process

Send documents via web based printing - with a branded printing website - or via mobile printing, to the printer's email address.

The submitted print jobs go to a PrintSpots webpage.

PrinterOn Corporation accepts the documents and creates print data formatted for the target printer.

PrintSpots mobile printing software runs on a PrintConnect or PC and uses a PrintValet keypad to confidentially release print jobs.

Privacy and Security

With PrinterOn, data is transferred and encrypted using Internet security standards ensuring privacy and security in every transaction.

Web transactions that include user information or print data are conducted using secure SSL communications.

Users may enter, or are given, a confidential print release code. In unattended applications, the documents are held encrypted until the user provides the code to release their document.

Print data in transit is encrypted using 128 bit AES and standard RSA public/private key pairs, ensuring that documents can only be encrypted with key pairs known by the PrinterOn software.
