

PrinterOn Mobile for iOS 3.6.0 - Release Notes

Version 3.6.0

PrinterOn Mobile for iOS offers an integrated solution for accessing both the PrinterOn Server Platform as well as PrinterOn's global network of Public Print locations in a single unified application. PrinterOn Mobile for iOS simplifies the process of discovering and printing to all PrinterOn's services.

NOTE: This release has an important security update, please see details below for more information.

PrinterOn Mobile for iOS supports iOS 9.0 or newer.

Product Changes and Enhancements:

- **Updated – Remove Support for Self-Signed Certificates** (IOS-733)

The PrinterOn Mobile Apps will no longer allow individual users to communicate with PrinterOn services without additional out of band configuration unless a valid and signed certificate is installed on the device.

Please note, this should not affect any production users, as it is already best practice and recommended to always use a signed certificate in production environments.

This update is an important step in increasing the overall security of the PrinterOn applications and simplify the introduction of new features in the future.

Users will no longer be prompted to accept communication with untrusted servers. The user will be required to manually install the servers root certificate to pre-approve communications.

- **New – iOS 12 support**

This version of the PrinterOn Application for iOS has been tested and validated with iOS 12.

System Requirements

- iOS 9.0 or newer
- MDM/MAM integrated applications require a configured MDM/MAM server and provisioned device to work correctly.

Please contact support@printeron.com if you have any questions.
